## **Analysis Report**

# Global dataset report

This report is the output of the Amazon SageMaker Clarify analysis. The report is split into following parts:

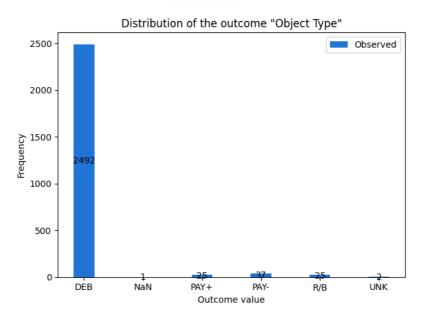

- 1. Analysis configuration
- 2. Pretraining bias metrics

#### **Analysis Configuration**

Bias analysis requires you to configure the outcome label column, the facet and optionally a group variable. Generating explanations requires you to configure the outcome label. You configured the analysis with the following variables. The complete analysis configuration is appended at the end.

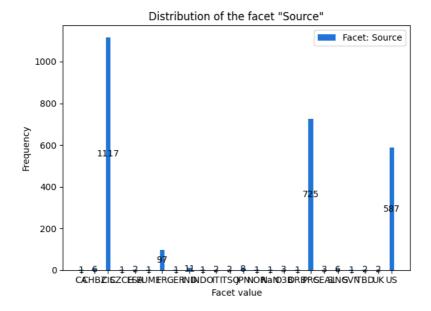

**Outcome label:** You chose the column Object Type in the input data as the outcome label. Bias metric computation requires designating the positive outcome. You chose Object Type = DEB as the positive outcome. Object Type consisted of values ['DEB', 'NaN', 'PAY+', 'PAY-', 'R/B', 'UNK'].

The figure below shows the distribution of values of Object Type .

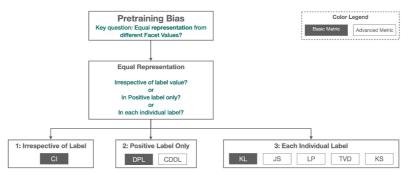

**Facet:** You chose the column Source in the input data as the facet. Source consisted of values ['CA', 'CHBZ', 'CIS', 'CZCH', 'ESA', 'EUME', 'FR', 'GER', 'IND', 'INDO', 'IT', 'ITSO', 'JPN', 'NOR', 'NaN', 'O3B', 'ORB', 'PRC', 'SEAL', 'SING', 'SVN', 'TBD', 'UK', 'US'] . Bias metrics were computed by comparing the inputs Source = US with all other inputs.

The figure below shows the distribution of values of Source .

### **Pre-training Bias Metrics**

Pretraining bias metrics measure imbalances in facet value representation in the training data. Imbalances can be measured across different dimensions. For instance, you could focus imbalances within the inputs with positive observed label only. The figure below shows how different pretraining bias metrics focus on different dimensions. For a detailed description of these dimensions, see <u>Learn How Amazon SageMaker Clarify Helps Detect Bias</u>.

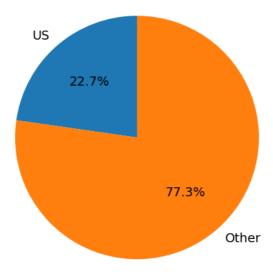

The metric values along with an informal description of what they mean are shown below. For mathematical formulas and examples, see the [Measure Pretraining Bias](https://docs.aws.amazon.com/sagemaker/latest/dg/clarify-measure-data-bias.html) section of the AWS documentation.

We computed the bias metrics for the label Object Type using label value(s)/threshold Object Type = DEB for the following facets:

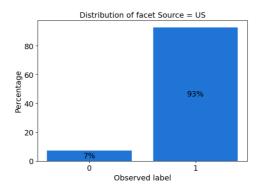

• Facet column: Source

The pie chart shows the distribution of facet column Source in your data.

#### Distribution of facet Source

The bar plot(s) below show the distribution of facet column Source in your data.

Facet Value(s)/Threshold: Source = US

Metric	Description	Value
Class Imbalance (CI)	Measures the imbalance in the number of inputs with facet values Source = US and rest of the inputs.	0.545
Difference in Proportions of Labels (DPL)	Measures the imbalance of positive observed labels between facet values Source = US and rest of the inputs.	0.047
Jensen-Shannon Divergence (JS)	Measures how much the observed label distributions of facet values Source = US and rest of the inputs diverge from each other entropically.	0.006
<u>Kullback-Leibler</u> <u>Divergence (KL)</u>	Measures how much the observed label distributions of facet values Source = US and rest of the inputs diverge from each other entropically.	0.022
Kolmogorov-Smirnov (KS)	Measures maximum divergence between the observed label distributions for facet values $\mbox{Source} = \mbox{US}$ and rest of the inputs in the dataset.	0.047
<u>Lp-norm (LP)</u>	Measures a p-norm difference between the observed label distributions associated with facet values	0.067
Total Variation Distance (TVD)	Measures half of the L1-norm difference between the observed label distributions associated with facet values $Source = US$ and rest of the inputs in the dataset.	0.047
